

Joining Stats Canada Data (MS Excel) to ArcGIS Data

1. Fields containing percentage data should be formatted in Excel as NUMERIC with decimal places.
2. Fields containing census tract numbers should be formatted in Excel as CUSTOM with a structure of 0000000.00
3. Save the formatted data in Excel as a DBF.
4. Add the DBF to your ArcGIS session.
5. Add a new field to the DBF with the structure as DOUBLE having a precision of 9 and a scale of 2. Run a field calculation on the added field based upon the existing field that contains the census tract numbers.
6. Add the census tracts from the corporate GIS.
7. Export the census tracts data from the corporate GIS to a working shapefile so that you can modify the data.
8. Add a new field to the exported corporate GIS data with the structure as DOUBLE having a precision of 9 and a scale of 2. Run a field calculation on the added field based upon the existing field that contains the census tract numbers.
9. Join the exported corporate data to the Stats Canada DBF data linking on the newly added census tract numbers field that you created in both pieces of data.
